### Circumcision Clamps

Assisted by two haemostats or ligatures the foreskin is pushed over the bellshaped protection - rod and the glans is placed into it. By now, the wing - nut is tightened as close as possible, so the foreskin in annular compressed. The foreskin is cut of with a scalpel, right next to the compression ring. The circumcision clamp remains a few minutes to avoid bleeding. In case that any large vein, specially the frenular artery, is cut through, a ligature must be set. The advantage of the method described is the cosmeticy favourable scar which is left after rejection of the small necrotized portion.

# Plaster Shears

**Special features:**

The construction of the open jaws avoids tiresome clogging by plaster remnants and allows furthermore an easy cleaning.  
 The shears do not glide off the plaster owing to the deep teething on the jaws.  
 The knives with hollow grinding have a better cutting ability and therefore less force is required.  
 The knives are guided by ball bearings.
